

# EVENT FLOORING

We carry a wide range of EventDeck and UltraDeck flooring to support your event flooring needs. This modular flooring is made from high-impact polypropylene co-polymer in a variety of colours. The flooring has a weight load of between 8,000-20,000 lbs sq/ft static load, on solid sub-surface (depending on type of flooring chosen). The flooring modules are either 12"x24" or 4"x12" and can be interconnected to make a flooring surface size to fit your dimensions.

This Event flooring is designed to be used with little ground preparation over grass, gravel, sand, soil, concrete, asphalt, ice, snow, mud, synthetic turf, rubberized tracks, and other standard surfaces.

Individual modules easily interconnect to form larger flooring sections without the need for tools. Modules feature circular support ribbing on the underside for added strength and weight distribution.

Edging is also available to create a transition between the install surface and the flooring.

Grass protection feature: EventDeck Modules feature an integrated moisture canopy which allows for moisture retention as well as drainage holes that provide drainage, ventilation, air, and small amounts of light to grass below. The underside is specially designed to protect grass and other sensitive surfaces by distributing weight across multiple support ribs. No sharp, unsupported edges exist to damage grass or synthetic turf.
